

Process Management (PCM)

PCM Overview

Required PA Information

Intent

Manages and implements the continuous performance improvement of processes and infrastructure to meet business objectives by identifying and implementing the most beneficial process improvements and making performance results visible, accessible, and sustainable.

Value

Ensures that processes, infrastructure, and their improvement contribute to successfully meeting business objectives.

Additional Required PA Information

This section left blank for future content.

Explanatory PA Information

Practice Summary

Level 1

- PCM 1.1 Develop a support structure to provide process guidance, identify and fix process problems, and continuously improve processes.
- PCM 1.2 Appraise the current process implementation and identify strengths and weaknesses.
- PCM 1.3 Address improvement opportunities or process issues.

Level 2

- PCM 2.1 Identify improvements to the processes and process assets.
- PCM 2.2 Develop, keep updated, and follow plans for implementing selected process improvements.

Level 3

- PCM 3.1 Develop, keep updated, and use process improvement objectives traceable to the business objectives.
- PCM 3.2 Identify processes that are the largest contributors to meeting business objectives.
- PCM 3.3 Explore and evaluate potential new processes, techniques, methods, and tools to identify improvement opportunities.
- PCM 3.4 Provide support for implementing, deploying, and sustaining process improvements.

- PCM 3.5 Deploy organizational standard processes and process assets.
- PCM 3.6 Evaluate and report the effectiveness of deployed improvements in achieving process improvement objectives.

Level 4

- PCM 4.1 Use statistical and other quantitative techniques to validate selected performance improvements against proposed improvement expectations, business objectives, or quality and process performance objectives.

Additional PA Explanatory Information

Process improvement focuses on the needs of the business to:

- Increase value for customers
- Align with business objectives
- Make business activities more efficient and effective
- Make the business more profitable
- Stay ahead of competition
- Increase employee satisfaction

Improvements to a process will often improve performance, but that is not the only reason to improve processes. For example, a strategic or regulatory change may drive an improvement or change to the process. It is also important to refine the improvement approach so that the processes are more useful to the organization.

Process management activities address the improvement of specific processes based on proposals from various sources which may include:

- Process evaluations including appraisals and quality assurance activities
- Feedback from users
- Measurement analysis results
- Performance results

An understanding of the workforce competencies should be used to develop and deploy processes that meet business objectives. As processes and work products are updated, their alignment with competencies is reviewed and verified.

Improvements that show demonstrable benefits help develop and support a culture that strives for ongoing improvement. A continuous improvement culture is essential to sustaining best practices and avoiding falling back into bad habits. Improving processes also increases employee satisfaction and retention rates by building an environment where people can be productive.

Related Practice Areas

Process Asset Development (PAD)

Context Specific

Agile Development

Context Tag:	Agile Development
Context:	Integrate agile techniques and ceremonies with other processes.

Agile teams collect retrospective data at the end of each Sprint that provides a rich source of improvement ideas. Some agile teams form a community of practice where individuals with a need for similar improvements can share experiences. Typically, retrospective sessions are focused on ad-hoc topics and improvements at a team level. Process management adds the systematic collection, analysis, and coordination of these improvements across the organization.

Process management activities can supplement the typical agile team to aid organizational learning. For example, agile teams collect data, but there is not necessarily a support structure to manage and use that data. The retrospective session does not typically or systematically assess each process. The adoption of process management practices produces more robust and sustainable organizational improvements.

Level 1

PCM 1.1

Required Practice Information

Practice Statement

Develop a support structure to provide process guidance, identify and fix process problems, and continuously improve processes.

Value

Reduces effort, cycle time, costs, defects, and waste, and increases performance.

Additional Required Information

This section left blank for future content.

Explanatory Practice Information

Additional Explanatory Information

The support structure enables consistent process implementation across the organization and provides a basis for cumulative, long-term benefits to the organization. It typically:

- Helps establish processes that make the work easier, more efficient, and less defect-prone
- Provides process guidance, such as process policies or other organizational directives
- Establishes responsibility for facilitating and managing the organization's process improvement activities, including coordinating the participation of others
- Provides the long-term commitment and resources required for improvement
- Enables effective and timely deployment of improvements

Senior management is responsible for establishing, communicating, and enforcing guiding principles, direction, and expectations. Senior management must:

- Actively support these efforts
- Set the tone for improvement
- Motivate continuous improvement
- Hold people accountable for improving the process

Example Activities

Example Activities	Further Explanation
Identify and apply a structure for supporting process related activities and keep it updated.	May include: • Organizational expectations and direction • Guidance for the process improvement

Example Activities	Further Explanation
Assign responsibilities and keep them updated for coordinating process related activities.	Typically includes: • Defined roles and responsibilities • Following the support structure

Example Work Products

Example Work Products	Further Explanation
Process support structure	A process support structure typically involves: • How the structure will be set up and updated • Funding and support • Training • Resources needed to sustain the structure • Roles and responsibilities that may include: ○ Management steering committee that sets strategies and oversees process improvement activities ○ Process group that facilitates and manages process improvement activities ○ Process action teams that define and implement process actions ○ Process owners that manage deployment ○ Practitioners that perform the process and provide feedback

PCM 1.2

Required Practice Information

Practice Statement

Appraise the current process implementation and identify strengths and weaknesses.

Value

Provides a systematic and realistic way to identify the most important opportunities for improvements.

Additional Required Information

This section left blank for future content.

Explanatory Practice Information

Additional Explanatory Information

Clearly define and communicate the reasons for performing an appraisal. These reasons can include:

- Identifying strengths and weaknesses
- Providing a realistic and objective insight into improvement opportunities
- Determining progress towards achieving improvement objectives
- Benchmarking

The appraisal can be performed against:

- A reference model, e.g., CMMI, ISO, or other standards relevant to the organization or industry
- The organization's processes

The purpose of an appraisal is to identify:

- Well performed activities
- Missing or gaps in processes
- Other business reasons and issues that could stimulate and guide successful improvement efforts, such as:
 - Regulatory requirements
 - Recurring problems

The primary focus of an appraisal is to compare the recorded and performed processes against the reference model. It is a quality assurance function to focus on the practiced processes versus the recorded processes.

Appraisal results should include enough detail so that they can be used for improvements. The acceptance gained with an appraisal can be significantly reduced if improvement actions are not supported and implemented by stakeholders performing the process roles.

Appraisals follow a process, are performed by qualified personnel, and may include:

- A formal assessment or evaluation
- A gap analysis
- A review
- A benchmarking activity
- Other methods

Example Activities

Example Activities	Further Explanation
Obtain sponsorship and support for the appraisal from senior management.	

Example Activities	Further Explanation
Define the scope of the appraisal.	Scope includes: • Organizational scope • Process scope • Model scope
Select or define the criteria and method for the appraisal.	Criteria may include: • Rigor • Sampling • Ratings • Re-appraisal triggers The appraisal method may include: • Gap analysis • Benchmarking • Review
Plan and schedule the appraisal.	
Perform the appraisal.	
Record and communicate the appraisal findings.	

Example Work Products

Example Work Products	Further Explanation
Appraisal plan and schedule	May include the: • Objectives • Scope • Method • Criteria • Resources
Appraisal findings	Typically includes: • Goals of the appraisal • Results including strengths and weaknesses

PCM 1.3

Required Practice Information

Practice Statement

Address improvement opportunities or process issues.

Value

Reduces costs by increasing efficiency and effectiveness of projects.

Additional Required Information

This section left blank for future content.

Explanatory Practice Information

Additional Explanatory Information

Assign responsibility to address improvement opportunities and process issues. Process issues may be addressed by improvement actions at various organizational levels.

Resolving issues is key to developing process acceptance and leads to further improvements.

Example Activities

Example Activities	Further Explanation
Assign relevant personnel to address the improvement opportunities and process issues.	
Identify and record the action items to address improvement opportunities and process issues.	
Address the opportunities and issues and communicate the results.	

Example Work Products

Example Work Products	Further Explanation
Action items	Include: • Actions to address identified improvement opportunities and process issues • Responsible people • Resources needed to complete actions

Level 2

PCM 2.1

Required Practice Information

Practice Statement

Identify improvements to the processes and process assets.

Value

Maximizes return on investment by focusing resources on the most critical business needs and objectives.

Additional Required Information

During process implementation and execution, identify strengths, weaknesses, opportunities, and issues for improvement. These can come from:

- Individuals
- Improvement proposals
- Lessons learned
- Results from a process appraisal
- Value stream analyses
- Causal analysis
- Measurements
- Quality evaluations
- Safety evaluations
- Security evaluations

Explanatory Practice Information

Additional Explanatory Information

Systematically analyze, prioritize, and record improvement suggestions. This analysis includes:

- Circumstances
- Sources
- Side effects
- Validity
- Benefits
- Effort
- Time to implement

Ensure that the analysis and evaluation are performed in a timely manner and that improvements are selected based on their expected value and impact. Objectively decide which improvements to select. It is generally not possible to implement all suggested improvements as it may be either too expensive or take too long. On the other hand, just addressing “low hanging fruit” may lead to minor changes or no changes at all. The better way is to determine criteria that helps select and deploy improvements with the highest business impact.

Example Activities

Example Activities	Further Explanation
Identify issues and opportunities.	
Group and analyze proposed improvements.	May include: • Cost benefit • Return on investment • Expected performance improvement • Prioritization • Barriers or risks
Record and keep updated criteria for selecting improvements.	May include: • Those required by law, regulations, or standards (now or in the future) • Supporting process improvement objectives • Avoiding waste • Ability to implement and execute
Select proposed improvements for implementation, deployment, and execution.	
Review selections with affected stakeholders.	
Record proposed improvements and communicate expected results.	Rationale for the proposed improvements may be captured in a business case, which may include the following information: • Value and rationale of each proposed action • Improvement based on the evaluation of criteria • Objectives • Constraints • Target users • Affected stakeholders • Risks • Estimated cost and schedule to implement • Expected results • Estimated return on investment • Deliverables A business case is typically reviewed with stakeholders and undergoes an approval process.

Example Work Products

Example Work Products	Further Explanation
Proposed improvement list	May include: • Proposed improvements • Reference to source • Assignment to processes • Risks and probability to resolve • Priority and business impact • Rationale as to why the proposals or a group of proposals is listed • Category of improvement • How to implement the proposed improvement
Business case	
Recorded selection criteria	
List of selected improvements for implementation, deployment, and execution	Refer to above proposed improvement list.

PCM 2.2

Required Practice Information

Practice Statement

Develop, keep updated, and follow plans for implementing selected process improvements.

Value

Enables more efficient and effective improvement efforts to meet business objectives.

Additional Required Information

Ensure the support structure for process improvement is addressed.

Explanatory Practice Information

Additional Explanatory Information

Manage the implementation of process improvements like a project.

Plans may include the full lifecycle of an improvement effort including:

- Estimating and planning
- Implementing or updating processes
- Piloting
- Analyzing expected and actual results
- Identifying risks or issues
- Identifying and involving stakeholders

- Deploying
- Conducting post-deployment evaluation
- Collecting feedback and lessons learned
- Monitoring progress

For larger efforts, consider an iterative or incremental approach instead of a one-time effort. For example, ensure deployable results are available as soon as possible to receive rapid feedback.

Example Activities

Example Activities	Further Explanation
Select performance improvements to be deployed.	Select improvements to be deployed based on their priority, resource availability, and improvement proposal evaluation and validation activity results. Selection process results can include the: • Selection criteria for proposed improvements • Characteristics of the target work • Disposition of each improvement proposal • Rationale for the disposition of each improvement proposal
Develop the plan based on the identified process improvements and review with stakeholders.	This should include identifying: • Tasks • Risks or opportunities • Performance criteria
Ensure that the deployment is announced, well-coordinated, and supported.	
Manage progress, review with stakeholders, and update plans as needed.	This should include monitoring: • Tasks • Risks or opportunities • Performance criteria
Develop or update process assets.	
Pilot the identified process improvements.	
Deploy the improvements.	Use results from pilots to update the deployment plans as needed.
Analyze and communicate the results of the deployed improvements.	Make process improvement accomplishments and benefits visible and understandable to all stakeholders.
Record improvement results.	May include: • Accomplishments • Timeframe • Effort and cost

Example Activities	Further Explanation
	• Results, e.g., improved performance, processes • Benefits Record achieved effect to the business and compare to the prior state.

Example Work Products

Example Work Products	Further Explanation
Process improvement plan	May include: • Approach, including deployment • Process improvement objectives • Roles, responsibilities, and authorities • Commitments • Tasks or items to work on • Stakeholders • Infrastructure • Effort • Resource plan • Budget and schedule • Expected overall value and performance results • Risks and success criteria • Pilot plan • Progress reporting
Action plan	May include: • Actions to be taken to implement the selected improvements • Responsibilities • Due dates
Developed or updated process assets	
Status report	
Recorded results	May include: • Results from process improvement activities • Benefit and value obtained from the improvements • Performance results • Nature and cause of failures • Effect on other processes and improvements

Related Practice Areas

Estimating (EST)

Monitor and Control (MC)

Planning (PLAN)

Level 3

PCM 3.1

Required Practice Information

Practice Statement

Develop, keep updated, and use process improvement objectives traceable to the business objectives.

Value

Ensures that process improvements focus on achieving business objectives.

Additional Required Information

This section left blank for future content.

Explanatory Practice Information

Additional Explanatory Information

This section left blank for future content.

Example Activities

Example Activities	Further Explanation
Identify and record improvement objectives.	
Review improvement objectives with affected stakeholders.	Review improvement objectives to ensure traceability to business objectives. Traceability enables verification that the improvement objectives contribute to meeting business objectives.
Monitor and update improvement objectives as needed.	

Example Work Products

Example Work Products	Further Explanation
Process improvement objectives that are traced to business objectives	

PCM 3.2

Required Practice Information

Practice Statement

Identify processes that are the largest contributors to meeting business objectives.

Value

Maximizes impact of improvement activities by focusing on and meeting the most important business needs.

Additional Required Information

This section left blank for future content.

Explanatory Practice Information

Additional Explanatory Information

Analyze process improvement objectives to determine which are the major contributors to achieving the business objectives. This may include analyzing:

- Business objectives and how well they are being achieved
- Business models
- Business environment
- Challenges
- Opportunities
- Planned changes

Process improvement objectives may be based on the results of a process appraisal, causal analysis, quality evaluation, or other input. These activities will help determine which improvement objectives have the highest priority.

Example Activities

Example Activities	Further Explanation
Review the current business model, business objectives, and business environment.	
Review potential internal or external business changes.	
Identify and record the relationships between the business objectives and processes.	Includes the tracing and mapping of processes and objectives.
Estimate the value of each process's contribution to achieving business objectives.	Consider the key capabilities that the business or project is targeting to build or improve, and the primary processes that contribute to those capabilities.

Example Activities	Further Explanation
Record, keep updated, and communicate the results to affected stakeholders.	Results include identification of the processes that are the major contributors to meeting objectives.

Example Work Products

Example Work Products	Further Explanation
Business model, objectives, and environment review results	Consider potential internal or external business changes.
Recorded relationships and traceability between the business objectives and processes	
Estimates of process contribution to achieving business objectives	Includes: • Priority of business objectives • Measure of contribution of each process to meeting the objective • Interrelationships of processes and objectives to each other • Analysis results of how processes contribute to meeting business objectives

PCM 3.3

Required Practice Information

Practice Statement

Explore and evaluate potential new processes, techniques, methods, and tools to identify improvement opportunities.

Value

Maximizes process innovation to more efficiently and effectively achieve objectives.

Additional Required Information

This section left blank for future content.

Explanatory Practice Information

Additional Explanatory Information

Process needs and processes are not static. Many new technologies, tools, and methods can significantly improve the performance of the organization. An organization should continuously search (both internally and externally) for these potential improvements, evaluate their effectiveness on performance, and adopt the ones that prove beneficial. Competency analysis of the workforce can assist in identifying and evaluating new processes, techniques, methodologies, and tools.

Proposed improvements can be incremental, innovative, or both:

- Incremental improvements generally originate with those who do the work, e.g., users of the process or technology. Incremental improvements can be simple and inexpensive to implement and deployed without the need for rigorous validation or piloting.
- Innovative improvements typically involve more radical change to the processes or technologies which can disrupt the normal workflow. Such changes typically require more effort and resources for validation, piloting, implementation, training, and sustainment.

When piloting, define and use criteria for selecting improvements. Criteria such as the risk, transformational nature of change, number of functional areas affected, or cost may indicate the need to pilot the improvement.

Example Activities

Example Activities	Further Explanation
Identify, research, and record improvements.	Research can be internally or externally focused, and may include: • Techniques • Methods • Process frameworks • Objective evaluations
Use established criteria to decide what documents and measures are critical enough to include in the organization's Process Asset Library (PAL) for use with other or future projects.	Update these criteria as organizational needs change. Monitoring the evolution of new technology can help identify new criteria for improvement.
Analyze and evaluate potential process improvement opportunities.	
Record, keep updated, and communicate the results to affected stakeholders.	

Example Work Products

Example Work Products	Further Explanation
Potential improvement opportunities	May include: • New ideas and innovations • Explanation of the ideas • Potential impact on business objectives • Initial cost versus benefit analysis

Related Practice Areas

Process Asset Development (PAD)

Workforce Empowerment (WE)

PCM 3.4

Required Practice Information

Practice Statement

Provide support for implementing, deploying, and sustaining process improvements.

Value

Ensures process improvements provide value to the organization over time.

Additional Required Information

This section left blank for future content.

Explanatory Practice Information

Additional Explanatory Information

Ensure the improved processes and assets are well communicated, trained, internalized, and perceived as useful.

Continuously support deployed processes and process assets. This support can come in the form of coaching, providing a help desk, training, etc.

Obtain approval and commitment from senior management and involve them in visibly and actively supporting the improvement.

Align improvement activities to avoid contradictory directions and wasted effort due to initiatives:

- Started in different parts of the organization
- Based on different standards

Senior management typically delegates the day-to-day process and improvement work to a team or a dedicated part of the organization.

Example Activities

Example Activities	Further Explanation
Identify the mechanisms needed to support process implementation and deployment.	May include: • User groups, e.g., communities of practice • Management communication, such as: ○ All-hands meetings ○ Newsletters ○ Webinars • Feedback to proposers of process changes
Ensure that implementation and deployment activities are planned and coordinated.	
Align multiple improvement activities.	Helps to avoid: • Conflicting goals • Cancelled efforts • Waste
Obtain senior management commitment to visibly and actively support implementation, deployment, and sustainment of the process.	
Provide a migration approach from current to newly deployed processes.	Approaches may vary depending on the criticality and impact of the process. Approaches may include: • Full implementation across the organization • Incremental changes via pilots • Iterative implementation by selected projects
Review the deployment results with the affected stakeholders	Include the people who perform the process. They are often the source of knowledge about the processes and constraints.
Provide records about the success, issues, obstacles, and progress of the supporting activities.	

Example Work Products

Example Work Products	Further Explanation
Plan for implementing, deploying, and sustaining improvement	Typically includes: • Improvement requirements • Deployment strategy • Estimated budget, schedule, risks, etc. • Updated vs. new processes • Communication methods

Example Work Products	Further Explanation
	• List of affected stakeholders • Implementation expectations • Migration from current to newly deployed processes
Implementation records	

Related Practice Areas

Governance (GOV)

Planning (PLAN)

PCM 3.5

Required Practice Information

Practice Statement

Deploy organizational standard processes and process assets.

Value

Ensures efficient, effective, and coordinated process deployment to reduce potential waste from overlapping improvements.

Additional Required Information

Coordinate the deployment of selected process improvements and assets in the organization.

Explanatory Practice Information

Additional Explanatory Information

Deploy processes and other process assets according to the plan. Involve personnel who are implementing and executing the process and related functions, e.g., training, quality assurance, in deployment. Training enables attendees to apply the processes in a consistent and sustainable way.

Provide ongoing support to prevent frustration when something goes wrong, or the user does not understand the process. A very effective supporting element is coaching. Mechanisms range from question-and-answer support at defined intervals or events to mentoring by guiding the users in applying processes, techniques, methods, and templates.

Monitoring implementation verifies that the organization's set of standard processes and other process assets are effectively deployed. It also helps to understand:

- What assets are being used
- Why they are being used
- Where they are being used
- How they are being used

Update defined processes to incorporate changes to the organization's set of standard processes and process assets. Updates help to ensure that activities benefit from what has been learned. If standard processes and process assets change or are newly developed, work may not need to change immediately. It may be better to delay deployment until the project can more effectively adopt the change.

Ensure dependencies among active and planned performance improvement efforts are understood and managed to ensure efficient and effective implementation and execution. There may be multiple improvement initiatives, concurrent improvements, and deployments in an organization. Coordinate the deployment of processes to avoid confusion, waste, contradictory results, and adverse effect.

To avoid overwhelming any part of the organization with too much change, it may be necessary to select and deploy different improvements to different parts of the organization. The selection of improvements to deploy should be sensitive to the needs of the respective parts of the organization.

Example Activities

Example Activities	Further Explanation
Ensure that sufficient support is available for the deployment.	
Identify projects for deployment of processes and assets.	Provide criteria for which work is subject to the deployment, to what extent and which timeframe, e.g., new work, all work, staggered approach.
Coordinate the deployment of improved processes with other improvement efforts.	Coordinating deployment includes: • Coordinating activities of work groups, support groups, and organizational groups for each improvement • Coordinating activities for deploying related improvements
Deploy the organizational set of standard processes and the organizational process assets to identified projects.	Examples of methods for deploying improvements include: • Deploying improvements incrementally rather than as a single deployment • Providing comprehensive consulting to early adopters of improvements in lieu of revised formal training
Monitor the deployment of improvements using deployment plans.	Confirm that deployment was completed in accordance with the deployment plan.
Review results of objective evaluations.	This helps determine how well the organization's set of standard processes has been deployed and how well they are working.
Identify, record, and track to closure issues related to	

Example Activities	Further Explanation
implementing the organization's set of standard processes.	
Review the deployment results with stakeholders.	

Example Work Products

Example Work Products	Further Explanation
List of where improvements of new or revised processes or assets will be deployed	Should include organizational processes and related process assets.
Deployment status report	May include: • Description of the improvement and deployments • Where, what, and how improvements are deployed • Issues with the deployment • Results of objective evaluations • Responsibility for implementation • Stakeholders • Deployment progress • Cost expended • Corrective actions to take • Benefits attained

PCM 3.6

Required Practice Information

Practice Statement

Evaluate and report the effectiveness of deployed improvements in achieving process improvement objectives.

Value

Ensures deployed processes are contributing to meeting process and performance improvement objectives.

Additional Required Information

This section left blank for future content.

Explanatory Practice Information

Additional Explanatory Information

Determine effectiveness of process improvements against stated objectives and communicate results to stakeholders. To be effective, the deployed process must make a significant positive change in performance of the work.

Compare process improvement results against stated process improvement objectives, to determine success and accomplishments, and take corrective action as appropriate.

Example Activities

Example Activities	Further Explanation
Analyze current improvement results against business, process, and performance improvement objectives and determine effectiveness of improvements.	
Record the results and communicate with affected stakeholders.	
Initiate and track to closure necessary corrective actions.	

Example Work Products

Example Work Products	Further Explanation
Process improvement evaluation report	May include: • Benefit and value obtained from the improvements • Comparison of business and process improvement objectives against the results and accomplishments • Need for further improvements • Causal analysis if needed

Level 4

PCM 4.1

Required Practice Information

Practice Statement

Use statistical and other quantitative techniques to validate selected performance improvements against proposed improvement expectations, business objectives, or quality and process performance objectives.

Value

Increases the success rate for performance improvement implementation.

Additional Required Information

This section left blank for future content.

Explanatory Practice Information

Additional Explanatory Information

Validate selected improvements in line with their improvement proposals by using statistical or other quantitative techniques. Methods for collecting validation data include:

- Discussions with stakeholders, e.g., in the context of a formal review
- Prototype demonstrations
- Pilots of suggested improvements

Statistical or other quantitative techniques for validating improvements include:

- Analysis of the statistical significance of the change, e.g., using a hypothesis test
- Process variation and stability analysis
- Process capability analysis
- Modeling and simulation

Validation activities can include simulations and modeling when the performance of the changed process and original process are statistically understood.

Example Activities

Example Activities	Further Explanation
Plan the validation.	Quantitative success criteria recorded in the improvement proposal can be useful when planning validation. Plans to validate selected improvements may include: • Target work and its characteristics • Use of pilots, if selected • Schedule for reporting results • Measurement and analysis activities

Example Activities	Further Explanation
	• Success criteria
Review validation plans with affected stakeholders.	
Perform each validation in accordance with the plan and record results.	
Use statistical or other quantitative methods to analyze the results of the validation.	Validation should include determining if objectives are being met.
Review, record and communicate the results of validation analysis.	Reviewing and recording results of analysis typically involves: • Reviewing results with stakeholders • Deciding whether to: ○ Proceed with deployment ○ Re-plan and continue the pilot ○ Rework implementation of the improvement ○ Terminate the deployment • Updating the disposition of improvement proposals associated with the deployment • Identifying and recording new improvement proposals • Identifying and recording lessons learned and problems encountered during the deployment including feedback to the improvement team and changes to the improvement • Evaluating validation results using statistical or quantitative criteria defined in the improvement proposal

Example Work Products

Example Work Products	Further Explanation
Validation plans	
Validation reports	May include: • Validation results of suggested improvements • Pilot results of suggested improvements • Quantitative and statistical analysis of the effects of the change • Description of the validation approach • Recommendations on the roll-out for a wider adoption, including success criteria
